

# Non-Gaussianity in CMB map seen through Needlets

WMAP 5-year Temperature Data Analysis

Davide Pietrobon

University of Tor Vergata - Rome  
Institute of Cosmology and Gravitation - Portsmouth

53° Congresso SAIIt - Pisa 2009

# Outline

- 1 Introduction
- 2 Techniques
  - Maths
  - 3D Graphs
- 3 Non-Gaussianity in the WMAP5 Data
  - Large Scale Anomalous Features
  - Limits on  $f_{\text{NL}}$
- 4 Conclusions

# $\Lambda$ CDM - The Cosmological Concordance Model

- One field inflation: nearly scale invariant perturbations;
- Dark Matter: perturbation growth and structure formation;
- Cosmological constant: late time acceleration of the Universe;
- Basic 6 parameters  $\Lambda$ CDM model.
- CMB thermal relic of the Big Bang
- Current constraints from CMB surveys (WMAP, BOOMERanG, CBI, ACBAR), Large Scale Surveys (2dF, NVSS, SDSS), SNe, HST
- Future: Planck, CMBpol, BOSS...

# Beyond the Simplest Cosmological Model

- Signature of non-standard inflation models (multifield inflation, ekpyrotic or cyclic scenarios...):
  - Deviation from Gaussian perturbations: large  $f_{NL}$ ,
  - Gravitational waves,
  - Polarization B-modes;
- Dark energy as a possible explanation of the late time evolution of the Universe:
  - Evolving scalar field;
  - Equation of state parameter;
  - Speed of sound.
  
- Technique: Spherical Needlets
- Foregrounds subtraction: needlets ILC (Fay et al. 2008), point sources, polarization

## 1 Introduction

- Large Scale Anomalous Features
- Limits on  $f_{\text{NL}}$

## 4 Conclusions

# Spherical Needlets

Marinucci et al. MNRAS **838** (2008) 539-545

*Pixel space: temperature map*

Dealing with masks, foregrounds and noise

$$T(\gamma) = \sum_{\ell m} a_{\ell m} Y_{\ell m}(\gamma) \quad \gamma \longleftrightarrow \mathbf{k} - \text{pixel}$$

*Harmonic space: angular power spectrum*

Cosmological parameter estimation

# Spherical Needlets

Marinucci et al. MNRAS **838** (2008) 539-545

Needlets in pixel space.

- Peculiar combination of spherical harmonics:

$$T(\hat{\gamma}) = \sum_{j,k} \beta_{jk} \psi_{jk}(\hat{\gamma})$$

- Expansion coefficients:

$$\beta_{jk} = \sqrt{\lambda_{jk}} \sum_{\ell} b\left(\frac{\ell}{B^j}\right) \sum_m a_{\ell m} Y_{\ell m}(\xi_{jk})$$

- $\sum_j \beta_j = \sum_{\ell} \frac{2\ell+1}{4\pi} c_{\ell}$ ;  $\beta_j = \langle \sum_k \beta_{jk}^2 \rangle$

$b(\ell/B^j)$  filter function in multipole domain.  $B = 1.8, j = 3, 4, 5$ .

- Small overlap between filters in  $\ell$ -space;
- Easy to encode (Healpix based).

# Spherical Needlets

# Anisotropic Features in WMAP 5-year Data

Pietrobon et al. Phys. Rev. D. **78** (2008) 103504

- Needlet analysis of CMB temperature map looking for anisotropic features: cold and hot spots
- $B = 1.8$  set applied to WMAP 5-year + Kq75 mask;

WMAP 5-year ILC temperature map.

WMAP 5-year broad mask: Kq75.

# Anisotropic Features in WMAP 5-year Data

Pietrobon et al. Phys. Rev. D. **78** (2008) 103504

We found three significant large scale structures at  $\ell$  10 to 20.

- The Cold Spot (Vielva et al. 2004);
- Two hot spots.

Spots detected.

# Angular Power Spectrum estimate: N vs. S

Pietrobon et al. Phys. Rev. D.78 (2008) 103504

*CMB power spectrum in needlet space up to  $\ell \sim 200$   $\beta_j = \sum_k \beta_{jk}^2 / N_{\text{pix}}$*

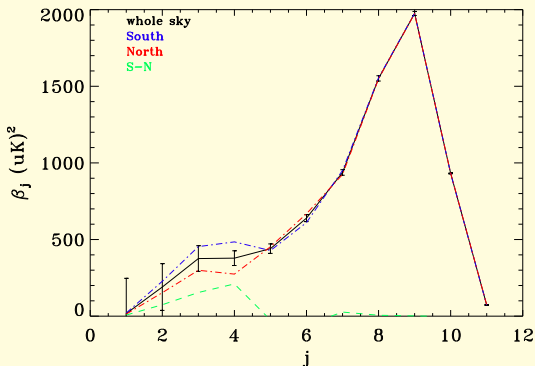

Whole sky power spectrum.

# Angular Power Spectrum estimate: N vs. S

Pietrobon et al. Phys. Rev. D.78 (2008) 103504

*CMB power spectrum in needlet space up to  $\ell \sim 200$   $\beta_j = \sum_k \beta_{jk}^2 / N_{\text{pix}}$*

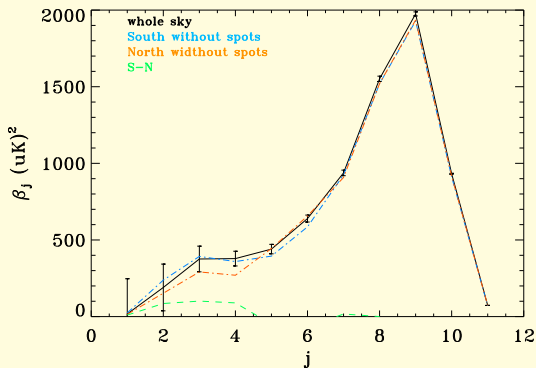

Significant difference between the power spectrum computed in the two hemispheres. (Hansen et al. (2008))

# Angular Power Spectrum estimate: N vs. S

Pietrobon et al. Phys. Rev. D.78 (2008) 103504

*CMB power spectrum in needlet space up to  $\ell \sim 200$   $\beta_j = \sum_k \beta_{jk}^2 / N_{\text{pix}}$*

The asymmetry decreases by a **factor 2** when spots are removed

# Cosmological parameter implication

Pietrobon et al. Phys. Rev. D. **78** (2008) 103504

- How do the spots affect the cosmological parameter estimation?
- The effect on the whole sky angular power spectrum exceeds the cosmic variance at one/two sigma in few multipoles
- We could expect a change of few  $10^{-3}$  on  $A_s$ ,  $\tau$ ,  $n_s$

# Cosmological parameter implication

Pietrobon et al. Phys. Rev. D. **78** (2008) 103504

- How do the spots affect the cosmological parameter estimation?
- The effect on the whole sky angular power spectrum exceeds the cosmic variance at one/two sigma in few multipoles
- We could expect a change of few  $10^{-3}$  on  $A_s$ ,  $\tau$ ,  $n_s$
- We ran MCMC but no significant changes were found
  - Cosmic variance;
  - degeneracy among parameters.

- 3 Non-Gaussianity in the WMAP5 Data**
  - Large Scale Anomalous Features
  - Limits on  $f_{\text{NL}}$**
- 4 Conclusions

# Limits on $f_{\text{NL}}$ from WMAP 5-year Data

Pietrobon et al. arXiv:astro-ph/0812.2478 (2008)

- Primordial non-Gaussianity due to second order effect:

$$\Phi(\mathbf{x}) = \phi_G(\mathbf{x}) + f_{\text{NL}}[\phi_G^2(\mathbf{x}) - \langle \phi_G^2 \rangle]$$

- Claim of detection at 2.5 sigma level by Yadav & Wandelt in WMAP 3-year data (Phys.Rev.Lett.100:181301,2008);  
 $f_{\text{NL}} \sim 80 \rightarrow$  non-standard early universe models (ekpyrotic, cyclic);
- Slightly lower confidence level in Komatsu et al. (2008) with WMAP 5-year data;

Fast cubic estimator KSW	bispectrum based	$\delta f_{\text{NL}} \sim \pm 60$ at 95% c.l.
Wavelets Curto et al.	“binned” bispectrum	$\delta f_{\text{NL}} \sim \pm 60$ at 95% c.l.
N-pdf Vielva & Sanz	bayesian analysis	$\delta f_{\text{NL}} \sim \pm 124$ at 95% c.l.

# Procedure Applied to the Data

Pietrobon et al. arXiv:astro-ph/0812.2478 (2008)

- Noise weighted combination of all channels: Q, V and W foregrounds reduced
- Extract needlet coefficients  $\beta_{jk}$
- Compute the skewness

$$S_j = \frac{1}{\tilde{N}_p} \sum_{k'} \frac{(\beta_{jk'} - \langle \beta_{jk'} \rangle)^3}{\sigma_j^3}$$

# Procedure Applied to the Data

Pietrobon et al. arXiv:astro-ph/0812.2478 (2008)

- Noise weighted combination of all channels: Q, V and W foregrounds reduced
- Extract needlet coefficients  $\beta_{jk}$
- Compute the skewness

$$S_j = \frac{1}{\tilde{N}_p} \sum_{k'} \frac{(\beta_{jk'} - \langle \beta_{jk'} \rangle)^3}{\sigma_j^3}$$

- Apply the same procedure to:
  - non-Gaussian simulations in order to find the best fit for  $f_{\text{NL}}$
  - Gaussian simulations to estimate covariance matrix (valid for small  $f_{\text{NL}}$ )

# Procedure Applied to the Data

Pietrobon et al. arXiv:astro-ph/0812.2478 (2008)

- Noise weighted combination of all channels: Q, V and W foregrounds reduced
- Extract needlet coefficients  $\beta_{jk}$
- Compute the skewness

$$S_j = \frac{1}{\tilde{N}_p} \sum_{k'} \frac{(\beta_{jk'} - \langle \beta_{jk'} \rangle)^3}{\sigma_j^3}$$

- Apply the same procedure to:
  - non-Gaussian simulations in order to find the best fit for  $f_{\text{NL}}$
  - Gaussian simulations to estimate covariance matrix (valid for small  $f_{\text{NL}}$ )
- We combined several sets of needlets in order to span as homogeneously as possible the multipole range.

# Constraints on $f_{\text{NL}}$

Pietrobon et al. arXiv:astro-ph/0812.2478 (2008)

*Skewness of the needlet coefficients*

- Lines for positive (dashed) and negative (dotted)  $f_{\text{NL}}$ ;
- Red diamonds: WMAP5 measurement.

# Constraints on $f_{\text{NL}}$

Pietrobon et al. arXiv:astro-ph/0812.2478 (2008)

- $\chi^2$  statistics

$$\chi^2(f_{\text{NL}}) = (X^d - \langle X(f_{\text{NL}}) \rangle)^T C^{-1} (X^d - \langle X(f_{\text{NL}}) \rangle)$$

$$f_{\text{NL}} = 30$$

$$-50 < f_{\text{NL}} < 110 \text{ at 95\% c.l.}$$

WMAP 5-year measured  $\chi^2$ .

# Constraints on $f_{NL}$

Pietrobon et al. arXiv:astro-ph/0812.2478 (2008)

- $\chi^2$  statistics

$$\chi^2(f_{NL}) = (X^d - \langle X(f_{NL}) \rangle)^T C^{-1} (X^d - \langle X(f_{NL}) \rangle)$$

$$f_{NL} = 30$$

$$-50 < f_{NL} < 110 \text{ at 95\% c.l.}$$

WMAP 5-year measured  $\chi^2$ .

- $f_{NL}$  skewness based estimator

$$S_j^{\text{obs}} = f_{NL} S_j^{\text{th}} |_{f_{NL}=1}$$

$$f_{NL} = \frac{\sum_{jj'} S_j^{\text{obs}} C_{jj'}^{-1} S_{j'}^{\text{th}}}{\sum_{jj'} S_j^{\text{th}} C_{jj'}^{-1} S_{j'}^{\text{th}}}$$

$$f_{NL} = 32 \pm 90 \text{ at 95\% c.l.}$$

Skewness template for  $f_{NL} = 1$ .

# Conclusions

- Non-Gaussian signature in the WMAP 5-year temperature map:
  - identified anomalous large scale features;
  - masking them reduces the North-South by a factor 2;
  - cosmological parameters are unchanged;
- constraints on the  $f_{\text{NL}}$  parameter:
  - promising limits:  $-50 < f_{\text{NL}} < 110$  at 95% CL;
  - $\chi^2$ -statistics and  $f_{\text{NL}}$  skewness estimator applied.
- Application of needlets to the Planck reference sky.
- Is there any foregrounds contamination? arXiv:astro-ph/0901.2572  
 $-4 < f_{\text{NL}} < 80$  95% c.l.
